Our baseball operations team is in constant need of unique front end interfaces that serve people in different roles (e.g. Front Office, Coaches, Scouts, and Players). A JSON file is attached with a list of players. We'd like you to create a player page view that displays relevant information and statistics about that player. We'll be looking for a few things in your project:

- Use of a modern JavaScript framework.
- Code and component reusability
- UI/UX choices
- Styling, use of color and spacing

Here is a list of components that could be useful for a player page:

- Player image
- Biographical information
- Statistics
- Upcoming schedule
- Player search bar
- Report list

The project should take around 8 hours to finish. You can send a zip file of all your code, or include me Paul.Turner@royals.com as collaborator on a GitHub repository. Also include any mock-ups or prototypes you create in your process whether or not you're able to implement them. Please include a list of any build tools or libraries and their versions that you used.
